# 1 Introduction

The Texas Instruments TMS320C28x Floating Point Unit Fast Run Time Support (FASTRTS) Library is a collection of optimized math routines written for C2000 devices that support either a single precision Floating Point Unit (FPU32), an FPU32 with Trigonometric Math Unit (TMU type 0), or a double precision FPU (FPU64).

These functions enable C/C++ programmers to take full advantage of the aforementioned hardware accelerators to speed up computation time. This document provides a description of each function included in the library.

**chapter 2** provides a host of resources on the FPU in general, as well as training material.

**chapter 3** describes the directory structure of the package.

**chapter 4** provides step-by-step instructions on how to integrate the library into a project and use any of the math routines.

**chapter 5** describes the single precision routines, with their accompanying variables, data types and structures.

**chapter 6** describes the double precision routines, with their accompanying variables, data types and structures.

**chapter 7** lists the performance of each routine.

**chapter 8** provides a revision history of the library.

Examples have been provided for each library routine. They can be found in the *examples* directory. For the current revision, the newest examples using FPU64 have been written and validated on the 64 device based *controlCard*. The FPU32 examples have been validated on 32 and 64 based *controlCard*.

## 2 Other Resources

The user can refer to the 32 and 64 device TRMs for detailed description.

Also check out the TI C2000 portfolio at: <http://www.ti.com/microcontrollers/c2000-real-time-control-mcus/overview>

And don't forget the TI community website: <http://e2e.ti.com>

Building the FASTRTS libraries and examples require **Codegen Tools v22.6.1** or later.

### 3 Library Structure

Header Files .....	8
Source Files .....	9

By default, the library and source code is installed into the c2000ware directory under the sub-folder

C:\ti\c2000\c2000ware\_<version>\libraries\math\FPUfastRTS

Figure. 3.1 shows the directory structure while the subsequent table 3.1 provides a description for each folder.

Figure 3.1: Directory Structure of the FASTRTS Library

Folder	Description
<base>	Base install directory. By default this is C:/ti/c2000/c2000ware_2_00_00_00/libraries/math/FPUfastRTS. For the rest of this document <base> will be omitted from the directory names.
<base>/ccs	Project files for the library. Allows the user to reconfigure, modify and re-build the library to suit their particular needs.
<base>/doc	Documentation for the current revision of the library including revision history.
<base>/examples	Examples that demonstrate usage of the library functions were built and validated for the 32 devices using the CCS 10.x IDE.
<base>/examples/common	Device specific setup, linker command files and ROM symbol libraries for the examples. Each device gets its own sub-folder.
<base>/include/fpu32	Header files for the single precision floating point FASTRTS library. These include function prototypes and structure definitions.
<base>/include/fpu64	Header files for the double precision floating point FASTRTS library. These include function prototypes and structure definitions.
<base>/lib	Static libraries with EABI configuration (single and double precision).
<base>/source/fpu32	Source files for the single precision floating point FASTRTS library.
<base>/source/fpu64	Source files for the double precision floating point FASTRTS library.

Table 3.1: FPU FastRTS Library Directory Structure Description

### 3.1 Header Files

The header files are sorted into two folders under “*include*”

- **fpu32**, single precision library header files
- **fpu64**, double precision library header files

The file “*fastrts.h*” is common to both libraries and defines new data types and macros. This legacy header file, “*C28x\_FPU\_FastRTS.h*”, is superseded by this new file, but it may be used without it.

## 3.2 Source Files

The source files are sorted into two folders under “*source*”

- **fpu32** - single precision library header files
- **fpu64** - double precision library header files

The source code contains the arithmetic and trigonometric routines, and in the case of the double precision library, the Fast Integer Division (FID) routines as well.

## 4 Using the FPU Library

Library Build Configurations .....	10
Integrating the Library into your Project .....	13
Confirming Which Library is Used .....	18

The source code and project(s) for the libraries are provided. The user may import the library project(s) into CCSv10 and be able to view and modify the source code for all routines and lookup tables. (see [Figure 4.1](#))

Figure 4.1: FPU Library Project View

### 4.1 Library Build Configurations

The single precision library has both COFF and EABI build configurations i.e. **ISA\_C28FPU32**, **ISA\_C28FPU32\_EABI** ([Figure 4.2](#)) while the double precision library has only EABI configuration **ISA\_C28FPU64\_EABI** ([Figure 4.3](#)).

The **ISA\_C28FPU32** and **ISA\_C28FPU32\_EABI** configurations are built with the `-float_support=fpu32` and `-tmu_support=tmu0` run-time support options enabled. Run-

ning a build on these configuration will generate **rts2800\_fpu32\_fast\_supplement\_coff.lib** and **rts2800\_fpu32\_fast\_supplement\_eabi.lib** in the lib folder. An **index library rts2800\_fpu32\_fast\_supplement.lib** is created using **libinfo2000** tool that can be linked against instead of directly linking to a coff or eabi-specific library. Thus any example irrespective of COFF/EABI can just link to this index library, the linker then uses the index library to automatically choose the appropriate version of the library to use based on the build attribute of the particular example.

**NOTE: ATTEMPTING TO LINK IN THIS LIBRARY INTO A PROJECT THAT DOES NOT HAVE THE FLOAT\_SUPPORT SET TO FPU32 WILL RESULT IN A COMPILER ERROR ABOUT MISMATCHING INSTRUCTION SET ARCHITECTURES**

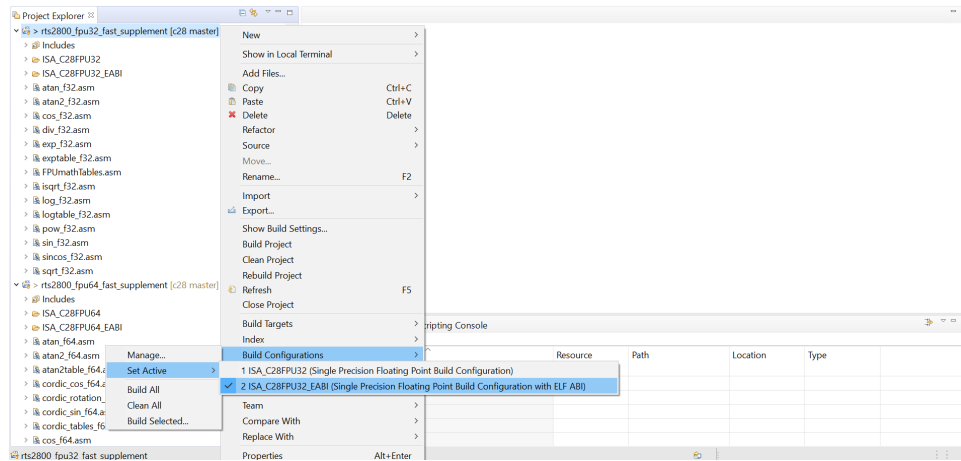

Figure 4.2: Single Precision Library Build Configuration

The **ISA\_C28FPU64\_EABI** configuration is built with the **-float\_support=fpu64** run-time support and **-idiv\_support=idiv0** option enabled. Running a build on this configuration will generate **rts2800\_fpu64\_fast\_supplement.lib** in the lib folder.

**NOTE: ATTEMPTING TO LINK IN THIS LIBRARY INTO A PROJECT THAT DOES NOT HAVE THE FLOAT\_SUPPORT SET TO FPU64 WILL RESULT IN A COMPILER ERROR ABOUT MISMATCHING INSTRUCTION SET ARCHITECTURES**

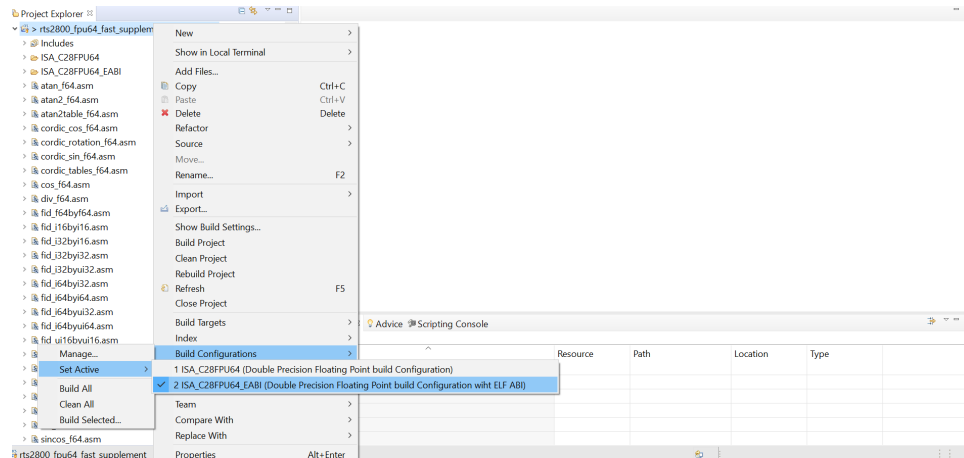

Figure 4.3: Double Precision Library Build Configuration

The table below summarizes all the build configurations and provides description of all single precision and double precision FPU FASTRTS libraries included in the folder.

Floating-Point precision	Library Name	Library Format	Build Configuration	Description
32-bit	rts2800_fpu32_fast_supplement_coff.lib	COFF	ISA_C28FPU32	Single precision COFF FPU FASTRTS library
	rts2800_fpu32_fast_supplement_eabi.lib	EABI	ISA_C28FPU32_EABI	Single precision EABI FPU FASTRTS library
	rts2800_fpu32_fast_supplement.lib	-	-	Index library for above single precision COFF and EABI variants, this needs to be used in project's linker options
64-bit	rts2800_fpu64_fast_supplement.lib	EABI	ISA_C28FPU64_EABI	Double Precision FPU FASTRTS library

Table 4.1: Build configurations and library description

**NOTE:** THE C2000 COMPILER WILL ONLY SUPPORT 64-BIT FLOATING-POINT INSTRUCTIONS IN EABI FORMAT, THAT IS WHY NO DOUBLE PRECISION COFF LIBRARY IS BEING PROVIDED. ANY PROJECT REQUIRING 64-BIT FLOATING-POINT SUPPORT MUST USE EABI. FOR MORE INFORMATION, PLEASE REFER TO TMS320C28X OPTIMIZING C/C++ COMPILER USER'S GUIDE [WWW.TI.COM/LIT/SPRU514](http://WWW.TI.COM/LIT/SPRU514)

**NOTE: DO TAKE CARE WHILE ADDING/COPYING THE SINGLE PRECISION FPU FASTRTS LIBRARIES TO THE CCS PROJECTS I.E. ALL THE VERSIONS (COFF, EABI) OF THE LIBRARY INCLUDING THE INDEX LIBRARY NEED TO BE COPIED TO THE PROJECTS SO AS TO ALLOW THE LINKER TO PICK THE CORRECT VERSION OF THE LIBRARY. THIS STEP IS NOT REQUIRED IF THE LIBRARIES ARE BEING LINKED THROUGH PROJECT BUILD OPTIONS. THUS THE RECOMMENDED PRACTICE IS TO ALWAYS LINK THE FPU FASTRTS LIBRARIES INSTEAD OF COPYING.**

## 4.2 Integrating the Library into your Project

To begin integrating the library into your project follow these steps:

1. Go to the **Project Properties->Resources->Linked Resources->Path Variables Tab** and add a new variable (see Figure 4.4), **FPU\_FASTRTS\_LIB\_ROOT**, and set its path to the root directory of the floating point Fast Runtime Support library in c2000ware; this is usually the **c28** folder.

Each example project requires two variables that are device specific,

- **DRIVERLIB\_ROOT**, points to the driver library of the target device on which the code will run
- **FASTRTS\_EXAMPLES\_COMMON**, points to the target specific device under the folder **c28/examples/common/<device>**; this folder contains the linker command files.
- **DSP\_EXAMPLES\_COMMONSRC**, contains basic system setup code used in each of the examples; they can be customized to meet the user's needs.

When switching to another compatible device, i.e. one having a hardware floating point unit, change the foregoing variables with the appropriate target device name; there must be a sub-folder in the “common” directory with the target device name.

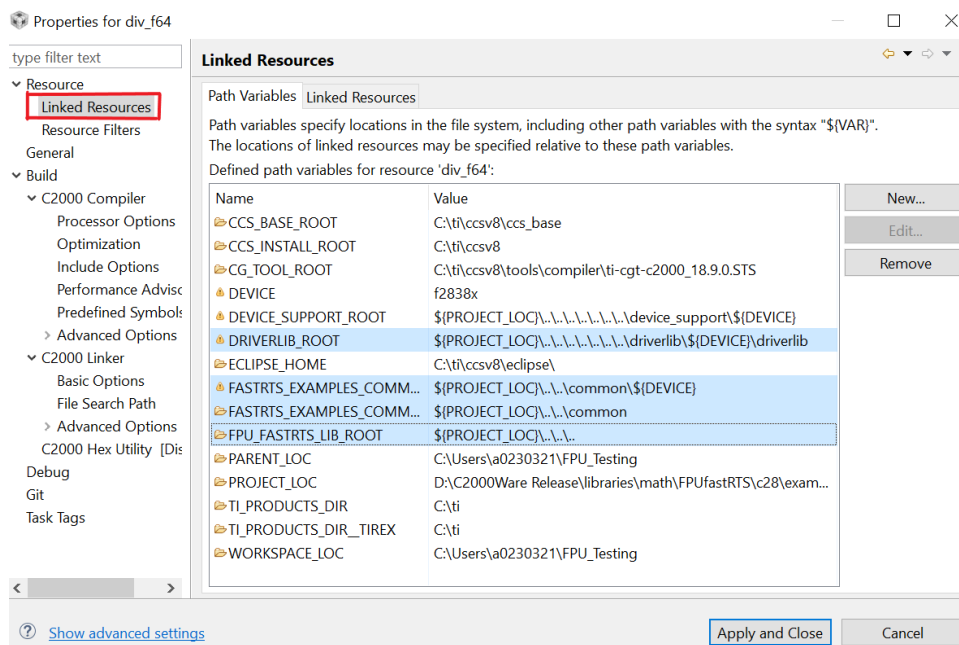

Figure 4.4: Creating a new build variable

Add the new path, **FPU\_FASTRTS\_LIB\_ROOT/include**, to the *Include Options* section of the project properties (Figure 4.5). This option tells the compiler where to find the library header files. In addition, you must add the driver library (**DRIVERLIB\_ROOT**) path as well as the common folder (**FASTRTS\_EXAMPLES\_COMMON**) and (**FASTRTS\_EXAMPLES\_COMMONSRC**) path for the target device in use.

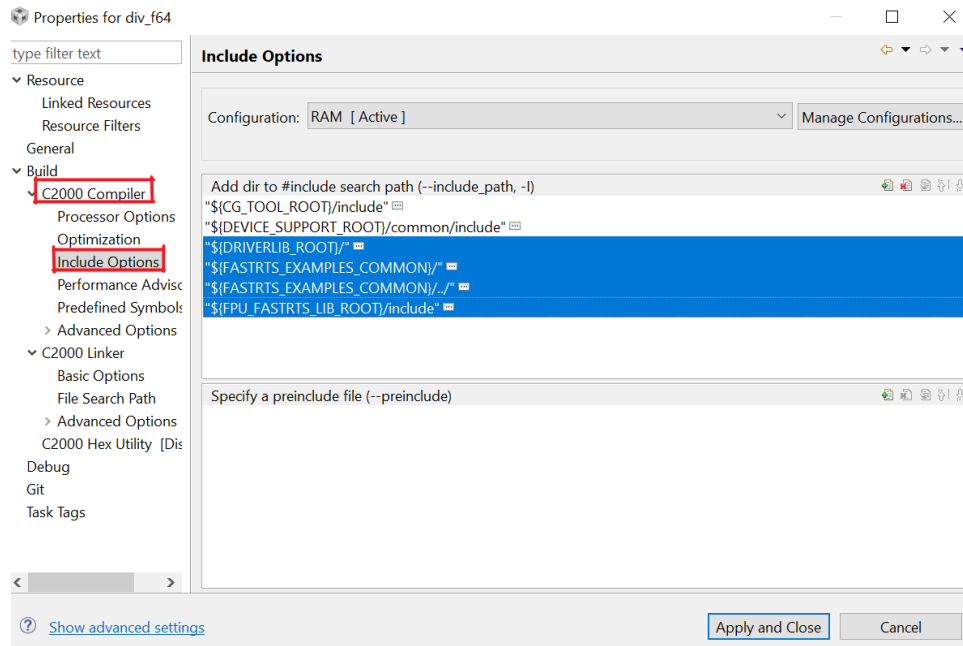

Figure 4.5: Adding the Library Header Path to the Include Options

- For the single precision library set the **-float\_support** option to **fpu32** in the **Runtime Model Options**. The user may optionally turn on **tmu\_support**; none of the library functions use TMU instructions but the library is built with TMU support turned on (Figure 4.6).

Figure 4.6: Turning on FPU32 support

- For the double precision library set the `--float_support` option to `fpu64` in the **Runtime Model Options** as shown in Figure 4.7.

Figure 4.7: Turning on FPU64 support

- Add the name of the library and its location to the **File Search Path** as shown in Figure 4.8 and Figure 4.9. For the single precision DSP library add `rts2800_fpu32_fast_supplement.lib`, and `rts2800_fpu64_fast_supplement.lib` for the double precision library.

**NOTE: BE SURE TO ENABLE FLOAT\_SUPPORT (AND, OPTIONALLY, TMU\_SUPPORT IF THE DEVICE SUPPORTS IT) IN YOUR PROJECT PROPERTIES**

Figure 4.8: Adding the library and location to the file search path

Figure 4.9: Adding the library and location to the file search path

5. In the project properties clear the *Runtime Support Library* option, as shown in Figure 4.10, or set it to auto. If you wish to include one of the other run time support libraries in your project, add it from the *File Search Path* option, as shown in Figure 4.8 and Figure 4.9, and place the fastRTS library above the other RTS library and select the **--priority** check box to ensure the compiler pulls the math routines from the fastRTS but the support routines (like

string operations) from the other RTS library.

Figure 4.10: Selecting the Runtime Support Library

- For sin32, cos32 and sincos32 examples on devices with limited memory, change optimisation settings as shown in Figure 4.11.

Figure 4.11: Changing Optimisation Settings

- If you wish to run the examples on another device, change the device strings on Properties -> Build -> Variables and Properties -> Resources -> Linked Resources.

### 4.3 Confirming Which Library is Used

After you build the project, check the .map file. This file is typically in the Debug directory of the project folder. This file will show which functions are being used from which library.

If the fastRTS library is linked in first, you will see something like the listing below (Figure 4.12). Notice the atan function is pulled in from the fastRTS library.

```
.text.2 0 00008000 00000000
00008000 00000002 driverlib.lib : sysctl.obj (.text:_SysCtl_setClock)
00008002 00000000 rts2800_fpu32.lib : fputc.obj (.text)
00008002 00000007 driverlib.lib : sysctl.obj (.text:_SysCtl_isPLVValid)

0000800d 00000000 rts2800_fpu32.lib : fputc.obj (.text)
0000800d 00000007 driverlib.lib : sysctl.obj (.text:_SysCtl_isPLVValid)
00008009 0000000f fastrts_examples_main.obj (.text)
0000800a 00000009 rts2800_fpu32.lib : setvbuf.obj (.text)
00008011 00000073 : fflush.obj (.text)
00008014 00000007 : _io_perm.obj (.text)
0000801b 0000005f : fclose.obj (.text)
0000801c 00000054 driverlib.lib : sysctl.obj (.text:_DCC_setCounterSeeds)
0000801c 00000056 : sysctl.obj (.text:_SysCtl_selectOscSource)
0000801e 00000056 rts2800_fpu32.lib : boot28.obj (.text)
0000801f 00000004 fastrts_atan.obj (.text)
00008020 0000003d rts2800_fpu32.lib : fseek.obj (.text)
0000802a 0000002a fastrts_examples_setup.obj (.text)
00008029 00000029 rts2800_fpu32.lib : exit.obj (.text)
00008025 00000025 driverlib.lib : sysctl.obj (.text:_DCC_enableSingleShotMode)
00008024 00000024 : sysctl.obj (.text:_SysCtl_selectXTAL)
00008024 00000024 rts2800_fpu32.lib : startup.obj (.text)
00008022 00000022 driverlib.lib : sysctl.obj (.text:_DCC_isBaseValid)
```

Figure 4.13: Determining the Library Association of a Function

It is possible to place functions from the library at specific locations in memory. You do this in the linker command file with the `--library` option. For example you could place `atan()` in the section “ramfuncs” by modifying the linker command file as follows,

```
ramfuncs : LOAD = FLASHC,
          RUN = RAMLS1,
          RUN_START(_RamfuncsRunStart),
          LOAD_START(_RamfuncsLoadStart),
          LOAD_SIZE(_RamfuncsLoadSize),
          PAGE = 0
          {
            --library=rts2800_fpu32_fast_supplement.lib<atan_f32.obj> (.text)
          }
```

## 5 Application Programming Interface (FPU32)

### 5.1 Introduction to the Single Precision Fast RTS Library API

The source code for the single precision library can be found under source/fpu32. [Table 6.1](#) lists all the available routines

Arithmetic and Trigonometric	
atan2f	float32 atan2f(float32 , float32);
atanf	float32 atanf(float32);
cosf	float32 cosf(float32);
expf	float32 expf(float32);
FS\$\$DIV	float32 FS\$\$DIV(float32 , float32);
isqrtf	float32 isqrtf(float32);
logf	float32 logf(float32);
powf	float32 powf(float32 , float32);
sincosf	void sincosf(float32 , float32* ,float32 * );
sinf	float32f sin(float32);
sqrtf	float32f sqrt(float32);

Table 5.1: List of Functions

The examples for each of these routines was built using **CGT v22.6.1** with the following options:

```
-v28 -mt -ml -g --diag_warning=225 --float_support=fpu32 --tmu_support=tmu0
--define=CPU1
```

Each example has at least two build configurations, **RAM** and **FLASH**. Although only RAM configurations are validated for and device.

## 5.2 Fast RTS (FPU32) Library Definitions and Types

### Modules

- [Fast RTS \(FPU32\) Library Definitions and Types](#)

- float32\_t [sinf](#) (float32\_t X)
- float32\_t [sqrtf](#) (float32\_t X)

### 5.2.1 Function Documentation

#### 5.2.1.1 \$\$DIV

Single-Precision Floating-Point Division.

**Prototype:**

```
float32_t FS
$$DIV(float32_t X,
      float32_t Y)
```

**Description:**

Replaces the single-precision division operation from the standard RTS library. This function uses a Newton-Raphson algorithm.

In C code, an expression of the type

$$Z = Y/X$$

will invoke FS\$\$DIV

**Parameters:**

- ← **X** single precision floating point numerator
- ← **Y** single precision floating point denominator

**Returns:**

the quotient

**Attention:**

1. This division routine computes  $y/x$  by first estimating  $(1/x)$ , performing a few iterations of Newton-Raphson approximation to improve the precision of  $1/x$ , and then finally multiplying that estimate by  $y$ ; it essentially computes  $y/x$  as  $(1/x)*y$ . If  $1/x$  is not perfectly representable in the floating point format it can lead to inaccuracies in the final result. The user is encouraged to use the standard runtime support library division routine if accuracy takes priority over speed.
2. These are the special cases for division

Case	Result	Flags
(0.0/0.0)	= +infinity	
(+FLT_MAX/+FLT_MAX)	= 0.0	LUF = 1
(-FLT_MAX/+FLT_MAX)	= -0.0	LUF = 1
(+FLT_MAX/-FLT_MAX)	= 0.0	LUF = 1
(-FLT_MAX/-FLT_MAX)	= -0.0	LUF = 1
(+FLT_MIN/+FLT_MAX)	= 0.0	LUF = 1
(-FLT_MIN/+FLT_MAX)	= -0.0	LUF = 1
(+FLT_MIN/-FLT_MAX)	= 0.0	LUF = 1
(-FLT_MIN/-FLT_MAX)	= -0.0	LUF = 1

Table 5.2: Special Cases for Division

**Note:**

1. This is a standard C math function and requires "math.h" to be included
2. For COFF executables float and double are both single precision 32-bit floating point types, therefore, the double and float variant of this function may be used interchangeably.

Cycles	Comment
25	Cycle count includes the call and return

Table 5.3: Performance Data

## 5.2.1.2 acosf

Single-Precision Floating-Point ACOS (radians).

**Prototype:**

```
float32_t
acosf(float32_t X)
```

**Parameters:**← **X** single precision floating point argument must be in the range  $[-1, 1]$ **Returns:**the arc tangent of a floating-point argument **X**. The return value is an angle in the range  $[-\pi, \pi]$  radians.**Note:**

1. This is a standard C math function and requires "math.h" to be included

2. For COFF executables float and double are both single precision 32-bit floating point types, therefore, the double and float variant of this function may be used interchangeably.

Cycles	Comment
60	Cycle count includes the call and return

Table 5.4: Performance Data

### 5.2.1.3 float32\_t asinf (float32\_t X)

Single-Precision Floating-Point ASIN (radians).

**Parameters:**

← **X** single precision floating point argument must be in the range  $[-1, 1]$

**Returns:**

the arc tangent of a floating-point argument X. The return value is an angle in the range  $[-\pi, \pi]$  radians.

**Note:**

1. This is a standard C math function and requires "math.h" to be included
2. For COFF executables float and double are both single precision 32-bit floating point types, therefore, the double and float variant of this function may be used interchangeably.

Cycles	Comment
55	Cycle count includes the call and return

Table 5.5: Performance Data

### 5.2.1.4 float32\_t atan2f (float32\_t Y, float32\_t X)

Single-Precision Floating-Point ATAN2 (radians).

**Parameters:**

← **Y** first single precision floating point argument

← **X** second single precision floating point argument

**Returns:**

the 4-quadrant arctangent of floating-point arguments X/Y. The return value is an angle in the range  $[-\pi, \pi]$

**Note:**

1. This is a standard C math function and requires "math.h" to be included
2. For COFF executables float and double are both single precision 32-bit floating point types, therefore, the double and float variant of this function may be used interchangeably.

Cycles	Comment
50	Cycle count includes the call and return

Table 5.6: Performance Data

#### 5.2.1.5 float32\_t atanf (float32\_t X)

Single-Precision Floating-Point ATAN (radians).

**Parameters:**

← **X** single precision floating point argument

**Returns:**

the arc tangent of a floating-point argument X. The return value is an angle in the range  $[-\pi, \pi]$  radians.

**Note:**

1. This is a standard C math function and requires "math.h" to be included
2. For COFF executables float and double are both single precision 32-bit floating point types, therefore, the double and float variant of this function may be used interchangeably.

Cycles	Comment
49	Cycle count includes the call and return

Table 5.7: Performance Data

#### 5.2.1.6 float32\_t cosf (float32\_t X)

Single-Precision Floating-Point Cosine (radians).

**Parameters:**

← **X** single precision floating point argument

**Returns:**

the cosine of a floating-point argument X (in radians) using table look-up and Taylor series expansion between the look-up table entries.

**Note:**

1. This is a standard C math function and requires "math.h" to be included
2. For COFF executables float and double are both single precision 32-bit floating point types, therefore, the double and float variant of this function may be used interchangeably.

Cycles	Comment
38	Cycle count includes the call and return

Table 5.8: Performance Data

#### 5.2.1.7 float32\_t expf (float32\_t X)

Single-Precision Floating-Point Exponent.

**Parameters:**

← **X** single precision floating point argument

**Returns:**

the exponent of a floating-point argument X using table look-up and Taylor series expansion of the fractional part of the argument.

**Note:**

1. This is a standard C math function and requires "math.h" to be included
2. the input domain is limited to  $+\log(\text{FLT\_MAX})$  ( $< +89$ )
3. For COFF executables float and double are both single precision 32-bit floating point types, therefore, the double and float variant of this function may be used interchangeably.

Cycles	Comment
61	Cycle count includes the call and return

Table 5.9: Performance Data

## 5.2.1.8 float32\_t isqrtf (float32\_t X)

Single-Precision Floating-Point 1.0/Square Root.

**Parameters:**

← **X** single precision floating point argument

**Returns:**

1.0 /square root of a floating-point argument X using a Newton- Raphson algorithm.

**Attention:**

1. isqrt(FLT\_MAX) and isqrt(FLT\_MIN) set the LUF flag.
2. isqrt(-FLT\_MIN) will set both the LUF and LVF flags.
3. isqrt(0.0) sets the LVF flag.
4. If X is negative, isqrt(X) will set LVF and return 0.0.

**Note:**

1. This function is not included in the standard RTS library. It is typically computed as  $1.0L/\text{sqrt}(X)$ . To use this function you must modify your code to instead call isqrt(X).
2. When migrating from an IQmath project, you can modify the IQmath header file to use isqrt(X) when configured for FLOAT\_MATH.
3. This is not a standard C Math function; it requires the "C28x\_FPU\_FastRTS.h" header instead of "math.h"
4. For COFF executables float and double are both single precision 32-bit floating point types, therefore, the double and float variant of this function may be used interchangeably.

Cycles	Comment
26	Cycle count includes the call and return

## 5.2.1.9 float32\_t logf (float32\_t X)

Single-Precision Floating-Point Natural Logarithm.

**Parameters:**

← **X** single precision floating point argument

**Returns:**

the natural logarithm of a floating-point argument X

**Note:**

1. This is a standard C math function and requires "math.h" to be included
2. the input must be greater than or equal to 1
3. For COFF executables float and double are both single precision 32-bit floating point types, therefore, the double and float variant of this function may be used interchangeably.

51	Cycle count includes the call and return

Table 5.11: Performance Data

## 5.2.1.10 void memcpy\_fastrts (void \* dst, void \* src, uint16\_t num\_words)

Fast memory copy function.

**Parameters:**

- ← **Dst** Destination address pointer
- ← **Src** Source address pointer
- ← **num\_words** Number of 16-bit words

**Returns:**

void

## 5.2.1.11 float32\_t powf (float32\_t X, float32\_t Y)

Single-Precision Floating-Point Power Function.

**Parameters:**

- ← **X** single precision floating point base argument
- ← **Y** single precision floating point exponent argument

**Returns:**

$X^Y$

**Note:**

1. This is a standard C math function and requires "math.h" to be included
2. the input X must be greater than or equal to 1
3. For COFF executables float and double are both single precision 32-bit floating point types, therefore, the double and float variant of this function may be used interchangeably.

Cycles	Comment
109	Cycle count includes the call and return

Table 5.12: Performance Data

#### 5.2.1.12 void sincosf (float32\_t *radian*, float32\_t \* *PtrSin*, float32\_t \* *PtrCos*)

Single Precision Floating Point Sine and Cosine (radians).

Returns both the sine and cosine of a floating-point argument X (in radians) using table look-up and Taylor series expansion between the look-up table entries.

**Parameters:**

- ← **X** single precision floating point argument
- **PtrSin** pointer to the sine of the argument
- **PtrCos** pointer to the cosine of the argument

**Returns:**

none

**Note:**

1. This is not a standard C Math function; it requires the "C28x\_FPU\_FastRTS.h" header instead of "math.h"
2. For COFF executables float and double are both single precision 32-bit floating point types, therefore, the double and float variant of this function may be used interchangeably.

Cycles	Comment
44	Cycle count includes the call and return

Table 5.13: Performance Data

#### 5.2.1.13 float32\_t sinf (float32\_t X)

Single-Precision Floating-Point Sine (radians).

**Parameters:**

- ← **X** single precision floating point argument

**Returns:**

the sine of a floating-point argument X (in radians) using table look-up and Taylor series expansion between the look-up table entries.

**Note:**

1. This is a standard C math function and requires "math.h" to be included
2. For COFF executables float and double are both single precision 32-bit floating point types, therefore, the double and float variant of this function may be used interchangeably.

Cycles	Comment
38	Cycle count includes the call and return

Table 5.14: Performance Data

## 5.2.1.14 float32\_t sqrtf (float32\_t X)

Single-Precision Floating-Point Square Root.

**Parameters:**

← **X** single precision floating point argument

**Returns:**

the square root of a floating-point argument X using a Newton- Raphson algorithm.

**Note:**

1. This is a standard C math function and requires "math.h" to be included
2. For COFF executables float and double are both single precision 32-bit floating point types, therefore, the double and float variant of this function may be used interchangeably.

**Attention:**

1. sqrt(FLT\_MAX) and sqrt(FLT\_MIN) set the LUF flag.
2. sqrt(-FLT\_MIN) will set both the LUF and LVF flags.
3. sqrt(0.0) sets the LVF flag.
4. If X is negative, sqrt(X) will set LVF and return 0.0.
5. This square root routine computes  $\sqrt{x}$  by first estimating  $\frac{1}{\sqrt{x}}$ , performing a few iterations of Newton-Raphson approximation to improve the precision of  $\frac{1}{\sqrt{x}}$ , and then finally multiplying that estimate by x; it essentially computes  $\sqrt{x}$  as  $\frac{1}{\sqrt{x}} \times x$ . If  $\frac{1}{\sqrt{x}}$  is not perfectly representable in the floating point format it can lead to inaccuracies in the final result. The user is encouraged to use the standard runtime support library division routine if accuracy takes priority over speed.

### 6.2.1 Data Structure Documentation

#### 6.2.1.1 float32u\_t

**Definition:**

```
typedef struct
{
    uint32_t ui32;
    int32_t i32;
    float f32;
}
float32u_t
```

**Members:**

**ui32** Unsigned long representation.  
**i32** Signed long representation.

**f32** Single precision (32-bit) representation.

**Description:**

32-bit Double Precision Float The union of a double precision value, an unsigned long and a signed long allows for manipulation of the hex representation of the floating point value as well as signed and unsigned arithmetic to determine error metrics. This data type is only defined if the compiler option `-float_support` is set to `fpu32`

### 6.2.1.2 float64u\_t

**Definition:**

```
typedef struct
{
    uint64_t ui64;
    int64_t i64;
    float64_t f64;
}
float64u_t
```

**Members:**

**ui64** Unsigned long long representation.

**i64** Signed long long representation.

**f64** Double precision (64-bit) representation.

**Description:**

64-bit Double Precision Float The union of a double precision value, an unsigned long long and a signed long long allows for manipulation of the hex representation of the floating point value as well as signed and unsigned arithmetic to determine error metrics. This data type is only defined if the compiler option `-float_support` is set to `fpu64`

## 6.2.2 Define Documentation

### 6.2.2.1 LIBRARY\_VERSION

**Definition:**

```
#define LIBRARY_VERSION
```

**Description:**

FAST RTS Library Version.

### 6.2.2.2 ZERO\_BY\_ZERO\_EQ\_INF

**Definition:**

```
#define ZERO_BY_ZERO_EQ_INF
```

**Description:**

Determines if 0/0 results in a result of infinity.

### 6.2.2.3 ZERO\_BY\_ZERO\_EQ\_ZERO

**Definition:**

```
#define ZERO_BY_ZERO_EQ_ZERO
```

**Description:**

Determines if 0/0 results in a result of zero.

## 6.2.3 Typedef Documentation

### 6.2.3.1 float32\_t

**Definition:**

```
typedef float float32_t
```

**Description:**

This line prevents conflicts with the data types and macros declared in FPU DSP library

### 6.2.3.2 v\_pfn\_v

a function pointer with a void pointer argument returning nothing

**Definition:**

```
#define void(*)

*0em          group__FASTRTS__F64_g5015b683a4bb7d53814ce90c394363c6
               v_pfn_v
               (void
               *
               )
```

## 6.2.4 Function Documentation

### 6.2.4.1 `float64u_t __c28xabi_div (float64u_t X, float64u_t Y)`

Single-Precision Floating-Point Division.

Replaces the single-precision division operation from the standard RTS library. This function uses a Newton-Raphson algorithm.

In C code, an expression of the type

$$Z = Y/X$$

will invoke FS\$DIV

**Parameters:**

← **X** double precision floating point numerator

← **Y** double precision floating point denominator

**Returns:**

the quotient

**Attention:**

1. This division routine computes  $y/x$  by first estimating  $(1/x)$ , performing a few iterations of Newton-Raphson approximation to improve the precision of  $1/x$ , and then finally multiplying that estimate by  $y$ ; it essentially computes  $y/x$  as  $(1/x)*y$ . If  $1/x$  is not perfectly representable in the floating point format it can lead to inaccuracies in the final result. The user is encouraged to use the standard runtime support library division routine if accuracy takes priority over speed.
2. These are the special cases for division

Case	Result	Flags
(0.0/0.0)	= +infinity	
(+DBL_MAX/+DBL_MAX)	= 0.0	LUF = 1
(-DBL_MAX/+DBL_MAX)	= -0.0	LUF = 1
(+DBL_MAX/-DBL_MAX)	= 0.0	LUF = 1
(-DBL_MAX/-DBL_MAX)	= -0.0	LUF = 1
(+DBL_MIN/+DBL_MAX)	= 0.0	LUF = 1
(-DBL_MIN/+DBL_MAX)	= -0.0	LUF = 1
(+DBL_MIN/-DBL_MAX)	= 0.0	LUF = 1
(-DBL_MIN/-DBL_MAX)	= -0.0	LUF = 1

Table 6.2: Special Cases for Division

**Note:**

1. This is a standard C math function and requires "math.h" to be included

Cycles	Comment
51	Cycle count includes the call and return

Table 6.3: Performance Data

6.2.4.2 `float64u_t atan (float64u_t X)`

Single-Precision Floating-Point ATAN (radians).

**Parameters:**← **X** double precision floating point argument**Returns:**the arc tangent of a floating-point argument X. The return value is an angle in the range  $[-\pi, \pi]$  radians.**Note:**

This is a standard C math function and requires "math.h" to be included

6.2.4.3 `float64u_t atan2 (float64u_t Y, float64u_t X)`

Single-Precision Floating-Point ATAN2 (radians).

Cycles	Comment
78	Cycle count includes the call and return

Table 6.4: Performance Data

**Parameters:**

- ← **Y** first double precision floating point argument
- ← **X** second double precision floating point argument

**Returns:**

the 4-quadrant arctangent of floating-point arguments X/Y. The return value is an angle in the range  $[-\pi, \pi]$

**Note:**

This is a standard C math function and requires "math.h" to be included

Cycles	Comment
81	Cycle count includes the call and return

Table 6.5: Performance Data

6.2.4.4 `float64u_t cos (float64u_t X)`

Single-Precision Floating-Point Cosine (radians).

**Parameters:**

- ← **X** double precision floating point argument

**Returns:**

the cosine of a floating-point argument X (in radians) using table look-up and Taylor series expansion between the look-up table entries.

**Note:**

This is a standard C math function and requires "math.h" to be included

Cycles	Comment
63	Cycle count includes the call and return

Table 6.6: Performance Data

6.2.4.5 `float64u_t isqrt (float64u_t X)`

Single-Precision Floating-Point 1.0/Square Root.

**Parameters:**

- ← **X** double precision floating point argument

**Returns:**

1.0 /square root of a floating-point argument X using a Newton- Raphson algorithm.

**Attention:**

1. `isqrt(FLT_MAX)` and `isqrt(FLT_MIN)` set the LUF flag.
2. `isqrt(-FLT_MIN)` will set both the LUF and LVF flags.
3. `isqrt(0.0)` sets the LVF flag.
4. If  $X$  is negative, `isqrt(X)` will set LVF and return 0.0.
5. This square root routine computes  $\sqrt{x}$  by first estimating  $\frac{1}{\sqrt{x}}$ , performing a few iterations of Newton-Raphson approximation to improve the precision of  $\frac{1}{\sqrt{x}}$ , and then finally multiplying that estimate by  $x$ ; it essentially computes  $\sqrt{x}$  as  $\frac{1}{\sqrt{x}} \times x$ . If  $\frac{1}{\sqrt{x}}$  is not perfectly representable in the floating point format it can lead to inaccuracies in the final result. The user is encouraged to use the standard runtime support library division routine if accuracy takes priority over speed.

**Note:**

1. This function is not included in the standard RTS library. It is typically computed as  $1.0L/\text{sqrt}(X)$ . To use this function you must modify your code to instead call `isqrt(X)`.
2. When migrating from an IQmath project, you can modify the IQmath header file to use `isqrt(X)` when configured for `FLOAT_MATH`.
3. This is not a standard C Math function; it requires the "fastrts.h" header instead of "math.h"

Cycles	Comment
59	Cycle count includes the call and return

Table 6.7: Performance Data

6.2.4.6 `float64u_t sin (float64u_t X)`

Single-Precision Floating-Point Sine (radians).

**Parameters:**

←  $X$  double precision floating point argument

**Returns:**

the sine of a floating-point argument  $X$  (in radians) using table look-up and Taylor series expansion between the look-up table entries.

**Note:**

This is a standard C math function and requires "math.h" to be included

Cycles	Comment
63	Cycle count includes the call and return

Table 6.8: Performance Data

6.2.4.7 `void sincos (float64u_t radian, float64u_t * PtrSin, float64u_t * PtrCos)`

Double Precision Floating Point Sine and Cosine (radians).

Returns both the sine and cosine of a floating-point argument  $X$  (in radians) using table look-up and Taylor series expansion between the look-up table entries.

**Parameters:**

- ← **X** double precision floating point argument
- **PtrSin** pointer to the sine of the argument
- **PtrCin** pointer to the cosine of the argument

**Returns:**

none

**Note:**

This is not a standard C Math function; it requires the "fastrts.h" header instead of "math.h"

Cycles	Comment
73	Cycle count includes the call and return

Table 6.9: Performance Data

6.2.4.8 `float64u_t sqrt (float64u_t X)`

Single-Precision Floating-Point Square Root.

**Parameters:**

- ← **X** double precision floating point argument

**Returns:**

the square root of a floating-point argument X using a Newton- Raphson algorithm.

**Note:**

This is a standard C math function and requires "math.h" to be included

**Attention:**

1. `sqrt(FLT_MAX)` and `sqrt(FLT_MIN)` set the LUF flag.
2. `sqrt(-FLT_MIN)` will set both the LUF and LVF flags.
3. `sqrt(0.0)` sets the LVF flag.
4. If X is negative, `sqrt(X)` will set LVF and return 0.0.

Cycles	Comment
63	Cycle count includes the call and return

### 6.3.1 Function Documentation

#### 6.3.1.1 FID\_f64byf64

Division: f64/f64.

**Prototype:**

```
void
FID_f64byf64 (double *p_num,
              double *p_den,
              double *p_quo)
```

**Parameters:**

- *p\_num,pointer* to the dividend
- *p\_den,pointer* to the divisor
- *p\_quo,pointer* to the quotient

**Returns:**

none

**Note:**

For best performance, make the arguments to the function global; local variables are pushed on to the stack and will cause pipeline stalls when multiple back-to-back stack accesses (read followed by write or vice versa) take place in the algorithm.

Cycles	Comment
36	Cycle count includes the call and return

Table 6.11: Performance Data

### 6.3.1.2 void FID\_i16byi16\_e (int16\_t \* p\_num\_rem, int16\_t \* p\_den\_quo)

Division: i16/i16 (Euclidean).

**Parameters:**

- *p\_num\_rem,pointer* to the dividend and subsequently remainder
- *p\_den\_quo,pointer* to the divisor and subsequently quotient

$$Q = \text{sgn}(n) \lfloor \frac{\text{dividend}}{|\text{divisor}|} \rfloor$$

$$R = \text{dividend} - |\text{divisor}| \times \lfloor \frac{\text{dividend}}{|\text{divisor}|} \rfloor$$

**Returns:**

none

**Note:**

For best performance, make the arguments to the function global; local variables are pushed on to the stack and will cause pipeline stalls when multiple back-to-back stack accesses (read followed by write or vice versa) take place in the algorithm.

Table 6.12: Performance Data

### 6.3.1.3 void FID\_i16byi16\_m (int16\_t \* p\_num\_rem, int16\_t \* p\_den\_quo)

Division: i16/i16 (Modulo or Floored).

**Parameters:**

- *p\_num\_rem,pointer* to the dividend and subsequently remainder

→ ***p\_den\_quo,pointer*** to the divisor and subsequently quotient

$$Q = \lfloor \frac{dividend}{divisor} \rfloor$$

$$R = dividend - divisor \times \lfloor \frac{dividend}{divisor} \rfloor$$

**Returns:**

none

**Note:**

For best performance, make the arguments to the function global; local variables are pushed on to the stack and will cause pipeline stalls when multiple back-to-back stack accesses (read followed by write or vice versa) take place in the algorithm.

Table 6.13: Performance Data

#### 6.3.1.4 void FID\_i16byi16\_t (int16\_t \* *p\_num\_rem*, int16\_t \* *p\_den\_quo*)

Division: i16/i16 (Truncated).

**Parameters:**

→ ***p\_num\_rem,pointer*** to the dividend and subsequently remainder

→ ***p\_den\_quo,pointer*** to the divisor and subsequently quotient

$$Q = trunc(\frac{dividend}{divisor})$$

$$R = dividend - divisor \times trunc(\frac{dividend}{divisor})$$

**Returns:**

none

**Note:**

For best performance, make the arguments to the function global; local variables are pushed on to the stack and will cause pipeline stalls when multiple back-to-back stack accesses (read followed by write or vice versa) take place in the algorithm.

Table 6.14: Performance Data

### 6.3.1.5 void FID\_i32byi16\_e (int32\_t \* p\_num\_rem, int32\_t \* p\_den\_quo)

Division: i16/i16 (Euclidean).

**Parameters:**

- **p\_num\_rem,pointer** to the dividend and subsequently remainder
- **p\_den\_quo,pointer** to the divisor and subsequently quotient

$$Q = \text{sgn}(n) \lfloor \frac{\text{dividend}}{|\text{divisor}|} \rfloor$$

$$R = \text{dividend} - |\text{divisor}| \times \lfloor \frac{\text{dividend}}{|\text{divisor}|} \rfloor$$

**Returns:**

none

**Note:**

1. while the divisor (denominator) is signed 16-bits, the quotient is larger than 16-bit and occupies the same memory location. Therefore the divisor must occupy a 32-bit location
2. For best performance, make the arguments to the function global; local variables are pushed on to the stack and will cause pipeline stalls when multiple back-to-back stack accesses (read followed by write or vice versa) take place in the algorithm.

## 7 Benchmarks

The benchmarks for the single precision library routines were obtained with the following compiler settings:

```
-v28 -mt -ml -g --diag_warning=225 --float_support=fpu32 --tmu_support=tmu0
```

while the benchmarks for the double precision library routines were obtained with the following compiler settings:

```
-v28 -mt -ml -g --diag_warning=225 --float_support=fpu64
```

Table. 7.1 summarizes the performance metrics for the single precision library routines. These numbers were obtained using profiling the code in the examples directory by simulating it on pre silicon platform

## 8 Revision History

### V2.09.00.00: Minor Update

Fixed bug that results in conflicts between FPU64 function names in the FPUfastRTS library and math.h

### V2.08.00.00: Minor Update

Renamed Fast memory copy function.

### V2.07.00.00: Minor Update

Added Fast memory copy function.

### V2.06.00.00: Minor Update

Added support for F28P65x.

### V2.05.00.00: Minor Update

Added support for F280013x and F280015x based control cards.

### V2.04.00.00: Minor Update

Added support for based control cards.

### V2.04.00.00: Minor Update

Migrated to compiler 22.6.1 and CCS 10.x.

### V2.03.00.00: Minor Update

Added support for based control cards.

### V2.01.00.00: Major Update

- All the libraries and examples have been migrated from COFF to EABI configuration.
- The examples are provided with RAM\_ROMTABLES configuration to make use pre-stored tables in ROM while computation.
- FLASH configuration is added to the examples (double-precision examples and  $\cos_{f32}$ ,  $\exp_{f32}$ ). Added double precision version of existing algorithms as well as new divisional algorithms
- ■ **Arithmetic and Trigonometric**

  - fid\_ui16byui16.asm
  - fid\_ui32byui16.asm
  - fid\_ui32byui32.asm
  - fid\_ui64byui32.asm

- fid\_ui64byui64.asm

The comments, examples and folder structure of the single precision library were modified and the following new algorithms added,

- exp\_f32.asm
- pow\_f32.asm

**V1.00: Moderate Update** No changes were made to the library itself. The following was done to incorporate the 1.00 release into the controlSUITE structure:

- Updated the directory structure to fit into controlSUITE.
- Added a project to build the library using CCS 4.
- Added an example project using a CCS 4 based project
- Updated this document for CCS 4 and controlSUITE information.

**Changes from Beta1 to V1.00** ■ Removed the version name from the library name. This makes updating to a new library easier.

- Added sincos() function
- Sin and Cos:
  - Corrected the constant value of 0.166 to 0.166667
  - Changed the truncated  $2\pi/512$  value to a rounded value of  $2\pi/512$ . Previously this value was truncated.
  - In Beta 1, the  $\text{int}(\text{Radian} * 512/(2\pi))$  calculation was done using float to 16-bit int. Changed this to 32-bit int to accommodate a larger range of input values.

---

# IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
